

#	Task Description	Classification	One-Line Rationale
1	Writing core API endpoint logic	Collaborate with AI	AI accelerates basic structure while I ensure business logic fits requirements.
2	Attending team check-ins & peer calls	Just Me	Requires real-time personal presence and human relationship building.
3	Drafting weekly progress update emails	Delegate to AI with Review	AI structures the summary, but I verify status details before sending.
4	Generating boilerplate unit tests	Fully Automate	Standardized syntax pattern that can be auto-generated via scripts/prompts.
5	Writing database migration scripts	Delegate to AI with Review	AI generates SQL schemas, but manual verification prevents data loss.
6	System architecture & database design	Just Me	High-level engineering trade-offs require human intuition and project context.
7	Debugging complex runtime errors	Collaborate with AI	Interactive pair-debugging helps narrow down stack traces faster.
8	Refactoring legacy backend functions	Collaborate with AI	AI suggests performance improvements while I preserve existing behavior.

#	Task Description	Classification	One-Line Rationale
9	Organizing project documentation	Fully Automate	Scripts/tools can automatically aggregate docstrings into API docs.
10	Researching third-party API capabilities	Delegate to AI with Review	AI condenses documentation, but I verify rate limits and auth methods.
11	Reviewing pull requests from peers	Delegate to AI with Review	AI flags formatting or syntax issues, but I evaluate overall logic.
12	Planning daily work priorities	Just Me	Priority setting depends on personal workload, energy, and goals.

Target Tasks & Success Definitions

1. Target Task 1: Generating FastAPI Route Handlers

- **Measurable Success Definition:** Clean, fully typed Python code with proper request/response Pydantic models and error handling that executes without syntax errors and passes all unit tests.

2. Target Task 2: Summarizing API Documentation

- **Measurable Success Definition:** Concise extraction of key endpoints, authentication headers, request payloads, and response status codes into a scannable 1-page reference guide generated in under 3 minutes.

3. Target Task 3: Refactoring Legacy Functions for Performance

- **Measurable Success Definition:** Backend function execution time is reduced, or logic is simplified into modular, readable helper functions without altering the original API output response contract.
